Motivations for Community Science

Expand capacity and generate knowledge in a data-poor shellfish fishery:

Local knowledge: contextual information to frame results and guide questions and methods.

Enhance community and shellfish harvester engagement:

Center local knowledge and needs.

Provide place-based experiences and connections for local students.

Enhance capacity through new research collaborations.

Addressing Local Needs

Municipal shellfish resource managers asked:

1. How many harvestable shellfish are on the flats now, and how many can we anticipate in the future?

2. Relatedly, how diverse are our shellfish resources? And how does this diversity influence harvester behavior–where they harvest, which species, how much?

3. What environmental factors affect shellfish populations, and on what temporal and spatial scales?

Case Study: Damariscotta River Estuary, ME, USA

How Can We Do Community Science?

Weaving together social & ecological knowledge:

Our community science program collects social and ecological data on shellfish abundance, distribution, and larval supply, as well as information on shellfish predators and harvester observations of change.

This information offers ecosystem-level understandings and grounds the research in local questions and needs.

What Have We Learned?

Shellfish Ecological Survey data can offer insights into the current standing stock of shellfish populations (Figure 1).

Survey data can help identify trends, e.g., both oyster and soft-shell clam abundance declined from 2021 to 2022, [based on initial general linear models (p<0.05, with R² values of >0.42 in each case)].

Green Crab Survey data (Figure 2) can identify seasons and locations of high and low predation to inform timing of conservation activities.

Additional benefits: centering local knowledge and needs, building capacity and knowledge, and fostering trust and learning communities.

Multiple Methods for Ecosystem-Level Knowledge

Shellfish Ecological Survey

Green Crab Survey

Softshell Clam Recruitment

Local Knowledge Survey

Enhance community and shellfish harvester engagement:

Center local knowledge and needs.

Provide place-based experiences and connections for local students.

Enhance capacity through new research collaborations.

Figure 1: Size distributions for oysters, soft-shell clams, and quahogs in the Damariscotta (2021-2022 surveys). Dashed lines show legal harvesting size limits.

Figure 2: Average abundance of green crabs found in a 1 m² sampling area at three long term monitoring sites across the 2022 summer and fall seasons. Error bars represent standard error of the sample means.

Acknowledgements

We thank A. Dorr, M. Lutkus, and the staff of the Town of Damariscotta, the Damariscotta-NY Community Shellfish Committee, K. Pellow, C. Strauch, J. Woodall, M. Willams, S. Swett, C. Rolfe, A. Papic, A. Hufnagel, J. O’Neal, B. Mirza, A. Leung, M. Yost, W. Spaller, and all the other high school and undergraduate student researchers who supported this research. This work was supported by anonymous friends of the Darling Marine Center, The Broad Reach Fund, Maine Shellfish Restoration and Resilience Project, NOAA Saltonstall-Kennedy award NAW14PF0005, NSF DEB-1632648 and NSF award #11A-165457 to Maine EPSCoR at the University of Maine, and the NEAMGLL Student Award.
