

# Current state of knowledge and research on potential effects of climate change on forest ecology

Dr. Jay Wason

School of Forest Resources

University of Maine

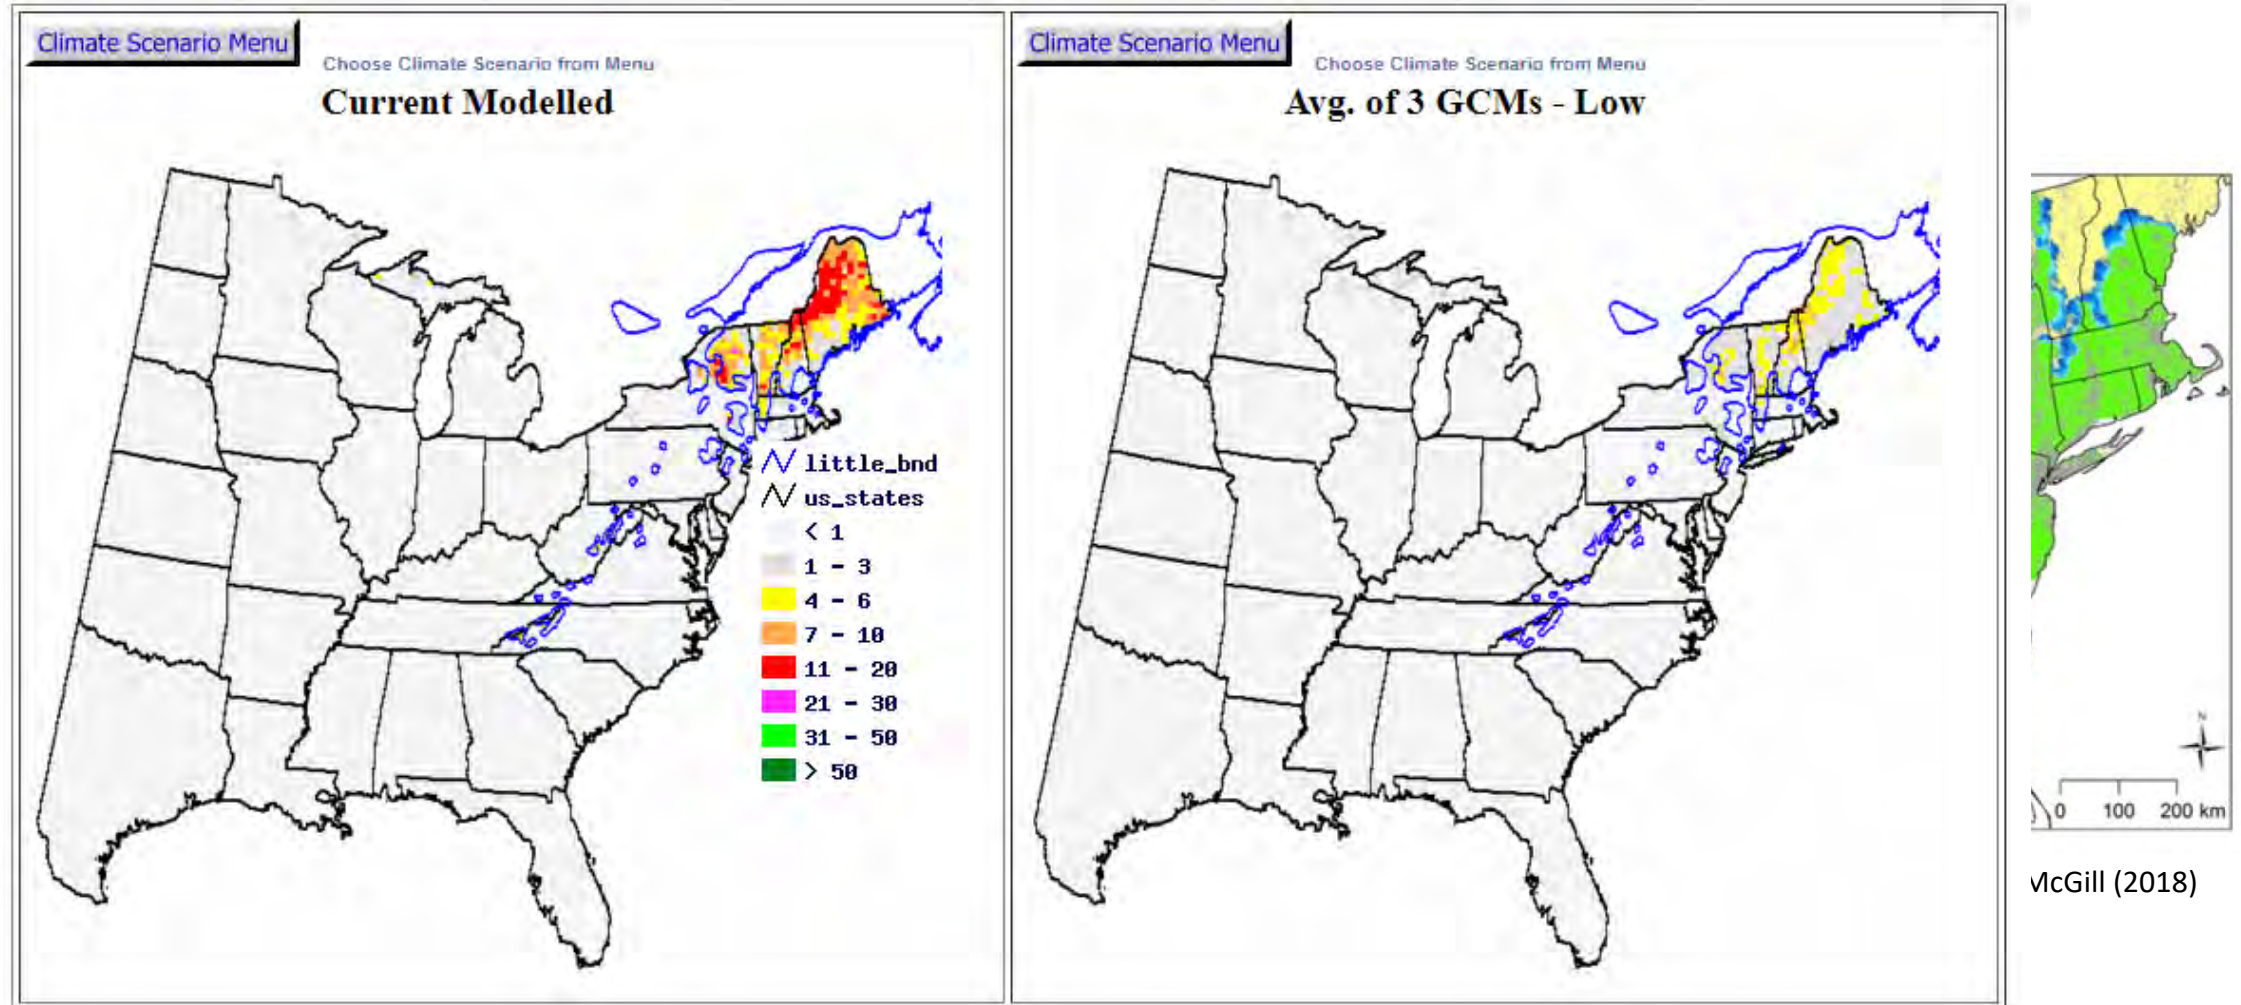

# Overview

- Forest responses to climate change are complex
- Novel future climates
- Good and bad of climate change
- We determine what our forests will look like in 100 years

# Changing climate and tree migration

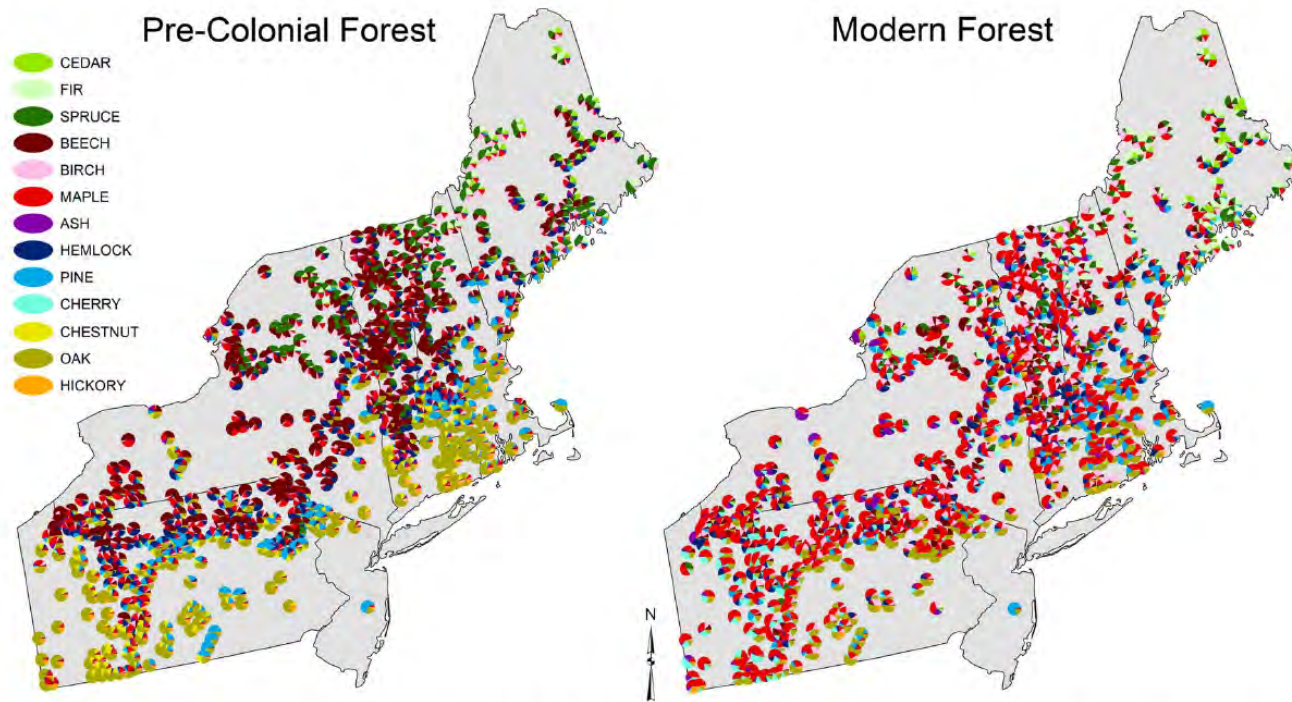

Red spruce

McGill (2018)

# Land-use drives forest composition

**Figure 3. Relative composition of pre-colonial era Witness Trees and modern inventory trees in 701 colonial townships in the northeastern USA.**

doi:10.1371/journal.pone.0072540.g003

# Increased forest productivity? It depends...

- Warming reduces photosynthesis during normal dry periods
- Increased growth for trees at their northern range margin

CO<sub>2</sub> fertilization increases productivity in some situations

David Hansen, University of Minnesota

[aspenface.mtu.edu/](http://aspenface.mtu.edu/)

# Climate change events and shifting phenology

Freezing damage to roots that lack an insulating layer of snow

Extreme winter warming event initiated budburst in ~50% of woody species in Wisconsin

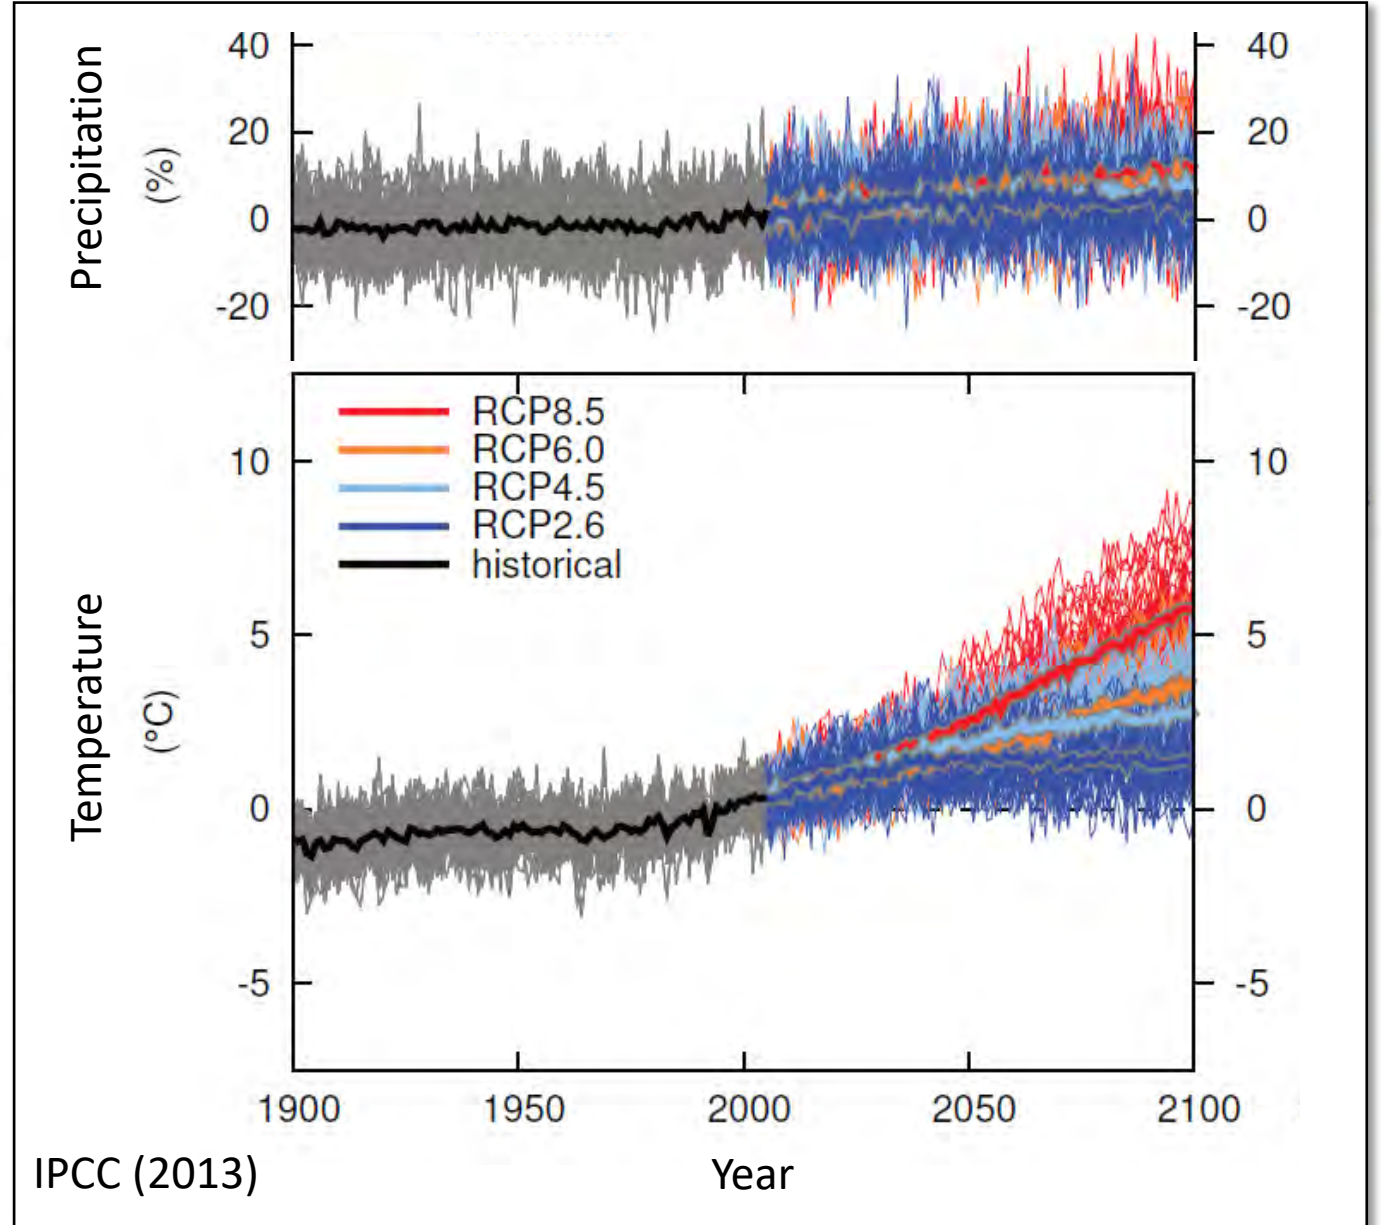

Ladwig et al. (2019)

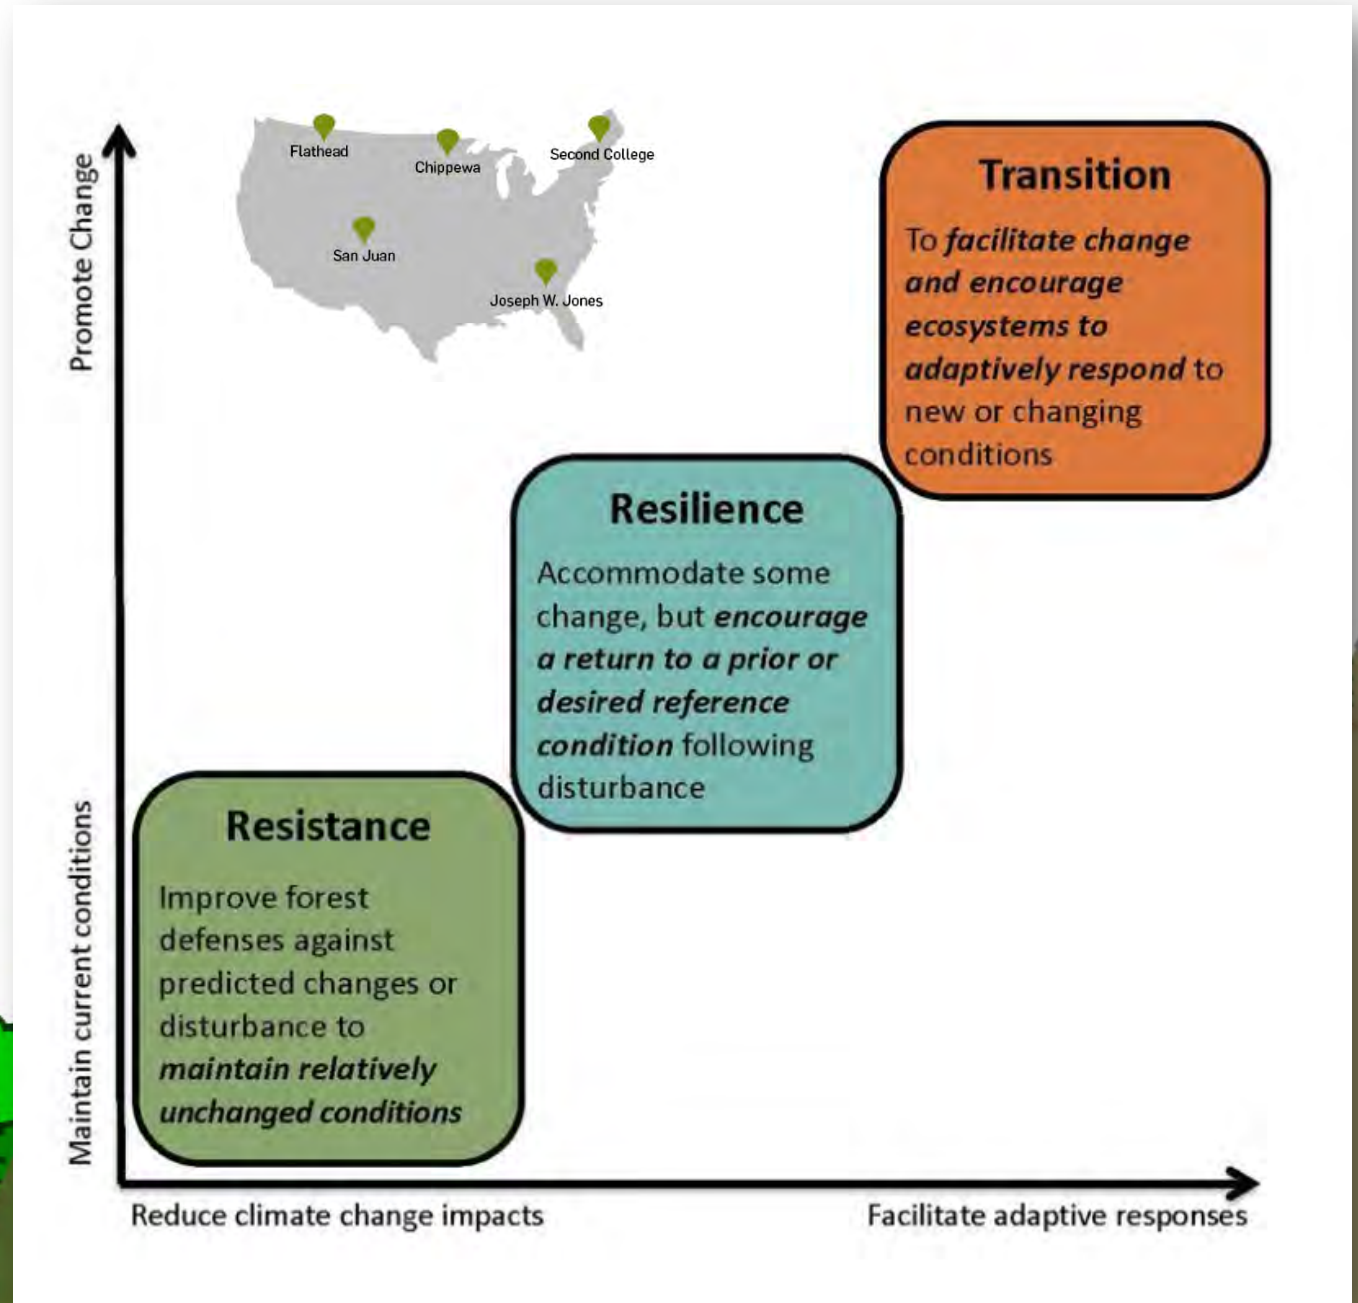

# What to expect in the future

- Rapid warming and novel climate conditions
- Lags in natural forest migrations
- Complex and unexpected biotic interactions
- Uncertainty
  - Short- vs. long-term predictions

# Ongoing Research

- Forest migration and canopy gaps
- Physiological tolerance of trees at trailing edge
- Ecosystem impacts
- Adaptive Silviculture for Climate Change

# Research Outcomes

- Climate change winners and losers
- Forest **resilience** and **resistance** to change and novel climate conditions
- Changing ecological communities
- Improved understanding of adaptive management practices

# Current Knowledge Gap

- Disconnect between suitable habitat models and tree migration
- Species ability to tolerate novel and rapidly changing climates (physiological ecology)
- Identifying climate refugia
- Biotic interactions of complex trophic webs

# Recommendations

- Determine physiological responses to changing climate across scales
- Identify climate change refugia and opportunities for facilitated migration
- Managing for and embracing uncertainty at different timescales
- Forest Management Workshops

Coastal  
Maine  
Climate  
Futures

# Summary

- Forest responses to climate change are complex
- Novel future climates present unique challenges but also opportunities
- Good and bad impacts in forests
- We determine what our forests will look like in 100 years
