Collaborative

## SCIENCE

- Fisheries Ecology
- Resource Economics
- Learning Sciences
- Sea Level Rise
- GHG Emissions
- Blue Carbon / Coastal Ecology
- Physical Oceanography
- Biological Oceanography
- Decision Science

## ENGAGEMENT

- Fishermen
- Farmers
- Fisheries Managers
- Students
- K-12 teachers
- Informal Educators
- Municipal Leaders
- Elected Officials
- Marine Businesses

## SOLUTIONS

- Ocean Data Products
- Sustainable Seafood
- Aquaculture
- Climate Finance
- Climate Risk
- Ocean Climate Policy
- Adaptation Engineering / Coastal Planning
- Climate Tech / Ventures

# Municipal Climate Action Program

Develop and deliver resources that build the knowledge, skills, and data capacity needed to develop community focused climate resilience plans.

Community Programming

High School Curriculum

Community Science

Community Mapping

Capacity Building

Municipalities need:

- local flood data.
- engaged and informed citizens.

Ecosystem  
Investigation — Projects ▾ About FAQ Partners  
Network

## Coastal Flooding: Storms and Sea Level Rise

What areas of our shoreline are most vulnerable and most important to us? What weather and tidal level conditions are associated with coastal flooding in our community?

### Why this matters

Sea levels are rising, storms are intensifying, and coasts are flooding more frequently. The goal of this project is to help coastal communities gather data to understand their unique risks and begin to identify priorities for building resilience.

## Coastal Flood Monitoring Sites in Maine

Ecosystem Investigation Network

The Coastal Flood Citizen Science Project ([https://investigate.gmri.org/project/coastal\\_flooding/](https://investigate.gmri.org/project/coastal_flooding/)) supports communities in gathering local data from coastal sites they care about. Click below to view participating communities and their coastal flood monitoring sites. Want your community to join? Email [gayle@gmri.org](mailto:gayle@gmri.org)

# Capacity Building

Comprehensive community planning needs to incorporate new modes of thinking and data sets that often raise more questions than bring answers.

## Resilience Planning Needs Assessment, 2019

- There is no common language.
- Communities don't have a sense of urgency.
- Framing decision-making through an economic lens makes the adaptation process more concrete, but it needs to be balanced with other perspectives, including social, cultural, and environmental.
- Decision support needs to be highly localized.
- A real focus on decision making would be less about tools, and more about a forum where communities can work together and learn from each other.
- Experts and stakeholders would benefit from understanding and working through different perspectives through exercises involving relevant, real-life scenarios.
- The importance of skills development and relationship building.

# Community Resilience Trainings

## Rural Resilience Trainings for Coastal Communities

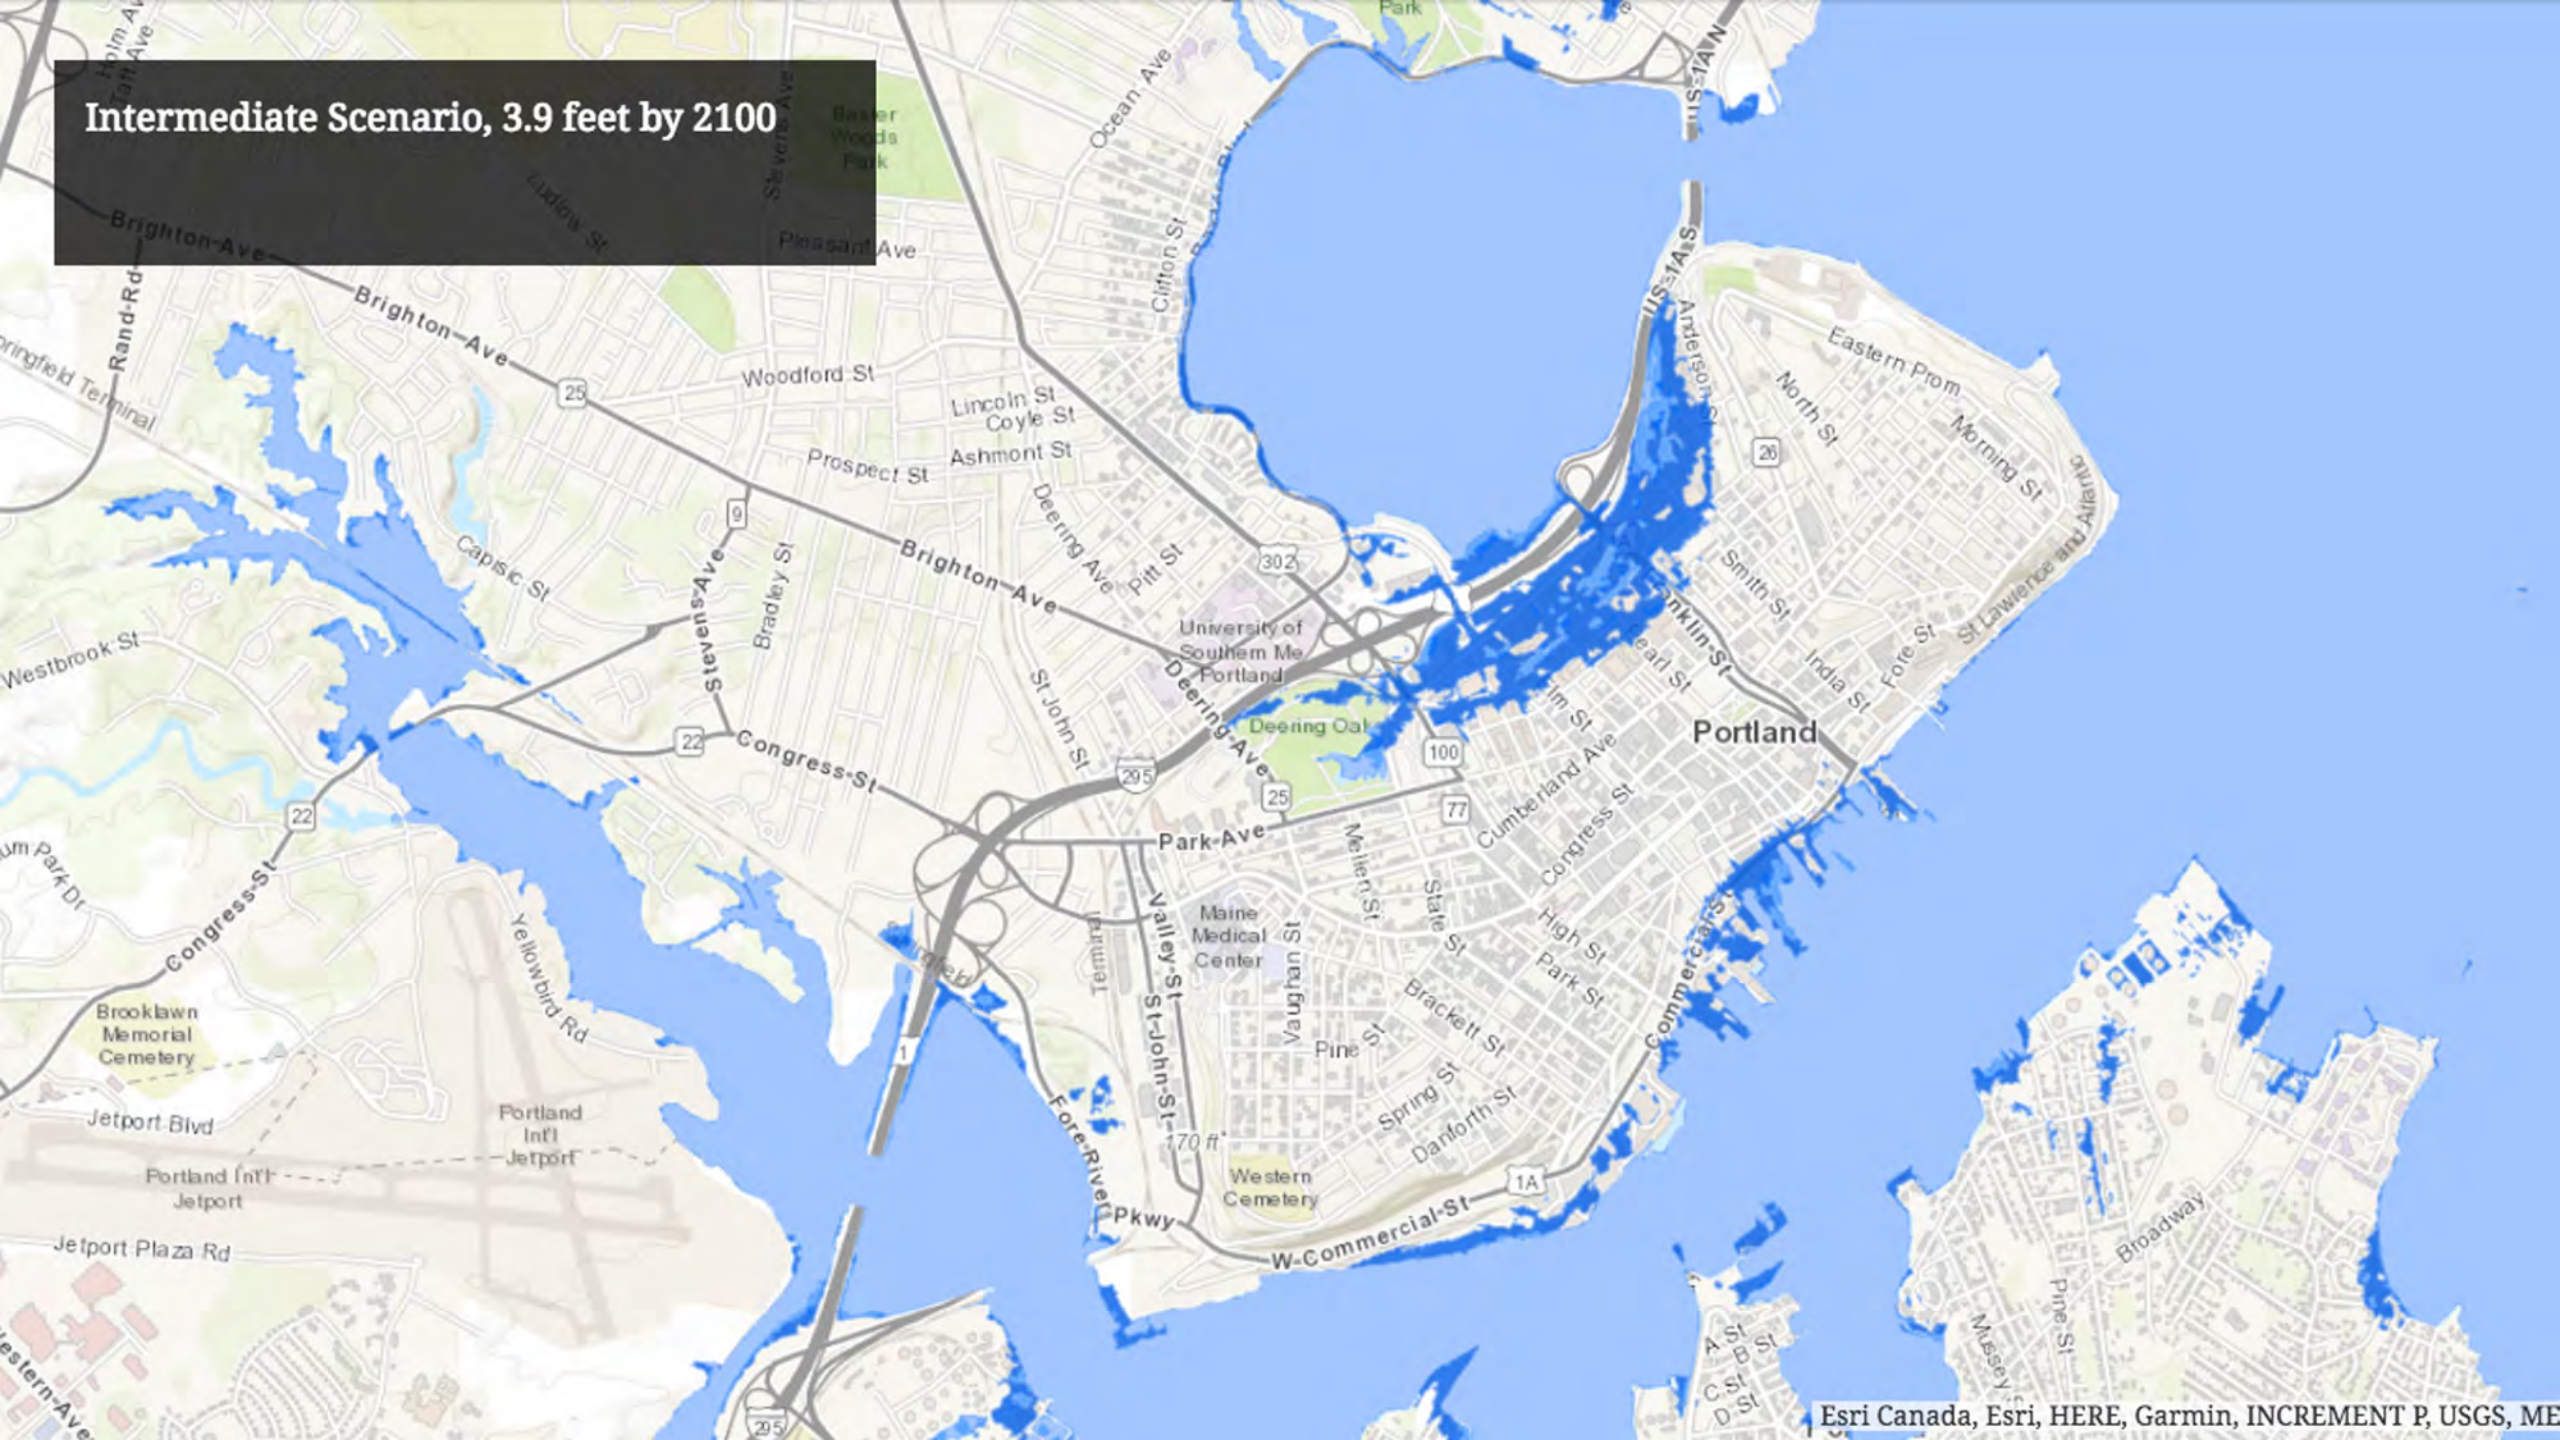

- Focus on knowledge, skill, and relationship building
- Current and emerging community leaders, representative of a community's diversity
- Support a process for decision making
- Build connections within and between communities
- Increase access to local/regional resources, tools, experts
- Provide space for conversation, reflection, planning
- Engage communities, broadly
- Hold equity at the heart of the work

## Partners

Island Institute, UMO, Upswell, GOPIF, MGS, MDEP, MSG, Wells Reserve, NOAA, Vinalhaven, St. George

A nautical chart of the Gulf of Maine and Fundian Channel, rendered in a blue monochrome style. The chart features depth soundings, magnetic variation lines, and various navigational markers. A compass rose is visible in the upper left corner. The text "Thank You!" is overlaid in the center in a large, white, sans-serif font.

# Thank You!
